

Abstrakt: Diploma thesis „The possibilities of diagnostics and treatment of children with developmental dyspraxia / developmental coordination disorder“ deals in its theoretical part with the explanation of the terms „developmental dyspraxia“ and „developmental coordination disorder“ and summarizes the newest findings about the classification of children's motional disorders and possibilities of their treatment. In its practical part, the thesis deals with certain possibilities of the DCD diagnostics. It uses Movement Assessment Battery for Children 2, which is instrumental to identify children movement difficulties. It is also engaged in praxis clinical examination of the chosen children and uses the DSDQ ,07 questionnaire. The thesis proves the existence of movement difficulties on certain children with ADHD, learning disabilities or autism spectrum disorder, as well as it proves the significant difference between standard scores of single components on children with learning disabilities. There has been discovered a worse quality of certain practical functions on chosen children and the result matches DCD in DCDQ ,07.
